Keywords: Cancellation; Elective surgery; Debremarkos comprehensive specialized hospital; Ethiopia.

Abbreviations: ASA: American society of anesthesiologist; DMU: Debre Markos University; DMCSH: Debre Markos Comprehensive Specialized Hospital; OR: Operation Room; OT: Operation Theatre.

Abstract

Background: High rates of cancellation of surgical procedures are common in hospital settings which may subsequently lead to economic loss to hospital besides burden given to patients, their families and medical teams. It is well recognized that cancellation of patients from elective theatre operating lists increases cost, decreases efficiency, duplicates workload and wastes operating room time. Cancellation of elective surgical procedures also causes significantly emotional trauma to the patients as well as their families and the community in general, and its impact on hospital resources is great due to prolonged hospitalization and high cost of health care [1]. This study aimed to assess the incidence and causes of patient cancellation scheduled for elective surgery in Debremarkos Comprehensive Specialized Hospital., Debremarkos, Northwest Ethiopia, 2022 GC.

Methods: A prospective cross sectional study was conducted on cancellation of scheduled surgery at Debremarkos comprehensive specialized hospital with total of 282 sample size from February-01-May-13 consecutive months of 2022 GC. The data was collected from operating room daily surgical schedule, preoperative anesthesia record sheet, primary physicians, and the anesthetist responsible for the preoperative assessment and conducting the case and by communicating patients if required. Analysis will be done by using SPSS (Version 20). Descriptive as well as analytic statistics are used for variables and data will present by tables, graphs, charts, and texts.

Result: A total of 1055 patients were scheduled for elective surgery in Debremarkos comprehensive specialized hospital. During the study period while 282 (26.7%) of the patients had their surgery cancelled for various reasons in Debremarkos comprehensive specialized hospital. The two most frequent reasons for cancellation were lack of bed (50.0%) and unfit for anesthesia (15.2%) in DMCSH.

Conclusion and recommendation: In conclusion, the cancellation rate of scheduled surgeries is high in the general adult surgery in Debremarkos comprehensive specialized hospital. The majority of causes are foreseeable, unavoidable and many are related to the hospital itself. We recommend that a facility for hospital preadmission be created.

Introduction

The advantages of a preoperative patient assessment prior to the surgery are to optimize medical condition of the patient before surgical procedure, improved patient safety and satisfaction, reduction of resources in terms of preoperative medical consultation, laboratory investigations and reduced length of hospital stay [2]. Cancellation of elective operation on the intended day of surgery is considered when the patient’s name has appeared on the list for surgical operations but the operation was not done on the intended scheduled date [3]. The Operation Theatre (OT) has been reported to be the heart of a hospital requiring considerable human resources and expenditure from the hospital budget [4]. Most hospitals in developed countries invest considerable resources in maintaining operating suites and having surgeons and theatre staff available on an agreed schedule. However, in developing countries where resources are limited, cancellation of elective surgical operations due to various preventable reasons is a common phenomenon in most hospitals. It is well recognized that cancellation of patients from elective theatre operating lists increases cost, decreases efficiency, duplicates workload and wastes operating room time [5].

Cancellation of elective surgical procedure causes significant emotional trauma to the patient as well as their families and the community. It is recognized that cancellation of patients from elective operation increase cost, decrease efficiency, duplicates work load and wastes operating room time [6]. Elective surgery cancellation always lead to insufficient utilization of man power and hospital resource and can also lead to an increase in patients treatment expenses due to prolonged hospital stay and in many cases, repetition of preoperative preparation and management [7]. The incidence of cancellation of elective surgical operations has been reported in literature to range from 20–40%. The causes of cancellation of elective surgical procedures are multifactorial and they tend to vary from one hospital to another [8]. In general, its impact on hospital resource is great due to prolonged hospitalization and high cost of health care [9]. Generally, the aim of this study was to analyze the frequency, associated factor and trend of cancellation of elective surgery operations in our environment and to identify the appropriate solutions for better patient management.

Methods and Materials

Study area, design and study period

A hospital-based prospective cross-sectional study was conducted in Amhara region, East Gojam Debre Markos Comprehensive Specialized Hospital on patients who were scheduled for elective surgery from February 01 to April 30, 2022 GC.

Source and study of populations

All elective patients appointed for major surgery at DMCSH from February 01 – May 13, 2022 GC and all patients cancelled from their elective surgery in surgical, obstetrics and gynecology, pediatrics and child health, and ophthalmic ward at DMCSH from February 01 – May 13, 2022 GC.

Inclusion criteria and exclusion criteria

All Patients scheduled for elective surgery at DMCSH from February 01 – May 13, 2022 GC and data without full information, Patient scheduled in minor OR and Patients who are operated on emergency.

Sample size determination and sampling procedure

A single population proportion formula, \( n = \left( Z_{a/2} \right)^2 \frac{p (1-p)}{d^2} \), is used to estimate the sample size to be included in the study. Due to lack of similar study about the cause and incidence of patient cancellation scheduled for elective surgery, a 50% is used for sample size determination by considering the following assumptions; 95% confidence interval, Margin of error of 5%.

The sample size is determined by using 95 % level of confidence (\( z = 1.96 \)), 50% as probability of success (\( p = 0.5 \)), 50% probability of failure (\( q = 1-p = 0.5 \)), and 0.05 as margin error i.e \( d = 0.05 \)

\[
d = Z_{a/2} (p q/n)^{1/2}
\]

\[
n = (Z_{a/2})^2 \frac{(p q)}{d^2}
\]

\[
n = (1.96)^2 * (0.5*0.5)/(0.05)^2
\]

\[
n = 384, since N< 10,000, Where N= study population (Biostatics, eighth edition, page 194).
\]

\[
f = ni/1+(ni/N)
\]

\[
f = 384/1+(384/1055)= 282
\]

Study variables

The dependent variable is those patients cancelled from elective surgery and the independent variable is Socio-demographic factors, planned procedure, Availability of surgical equipment.

Data collection tool and procedures

The data were collected using a structured questionnaire. The questionnaire is developed in English version by revising literature from previous similar studies and a number of questions that address the objective of the study were developed. The data had been collected by three-fourth and two third-year anaesthesia students after being given adequate training.

Data quality assurance and data management

The two-day training was given about data collection procedure for those data collectors and supervisors regarding the study purpose, how to conduct the interview, how to administer the questionnaire, how to take consent, keep confidentiality and respect the right of the participant.

Data processing and analysis

The data was processed and analyzed using SPPS version 20. The data was interpreted using descriptive statistics computed...
to determine frequency and percentage. The result will be presented by tables, bar graph and pie-charts.

**Result**

During the study period while 204 of the patients had their surgery cancelled for various reasons in Debre Markos Comprehensive Specialized Hospital. Reasons for cancellation are summarized in (Table 2) for DMCSH. The two most frequent reasons for cancellation were lack of bed (50.0%) and patient unfit for anesthesia (15.2%) in DMCSH. The rest (34.8%) causes of cancellation in DMCSH included NPO time of the patient, no availability of surgical equipment, delayed lab result, surgeon not available, patient refusal, patient on medication, no need of surgery, acute medical illness, patient requires other surgical work up, no availability of OR time, anesthetist not available and others.

General surgery had the highest number, 100 (49.0%) of cancelled cases in DMCSH (Table 2) However, ENT surgery had the lowest 2 (1.0%) cancellation rate in DMCSH. The most common reason for cancellation of elective General surgical cases was lack of bed in DMCSH.

In this study similar to a retrospective cross sectional observational study, selecting all patients scheduled for surgery at the hospital institution in Colombia the causes of cancellation, 93 (38.1%) were attributable to the institution, 99 (40.6) to patients, and 52 (21.3%) to medical orders [12] cancellation records of all elective surgeries scheduled between June 1, 2012, and Jan. 31, 2016, at a medium-sized, tertiary care, academic center in Malawi were retrospectively reviewed. Across 11 surgical specialties, 2933 of 20 881 surgeries (14.0%) were cancelled and of these, 2448 (83.5%) were for administrative or structural reasons [13].

In this study similar to a prospective cross sectional study which was conducted at jimma university medical center a total of 454 patients were scheduled to undergo elective surgical procedures, of this 92 patients’ procedures were cancelled. The majority of causes of cancellation of surgical operations were related to hospital administration in 47.83% [14].

In this study contrast to the studies conducted in Nigeria [15], Uganda [16], Brazil [17] and University of Gondar [18] were contrast with the result of our study. This reason may be infera structure recourses available and good administrative in those hospitals set up.

Conclusion and recommendation

The cancellation rate of scheduled surgeries is high in general adult surgery in DMCSH. The majority of causes are foreseeable and avoidable and many are related to the hospital itself.

We recommend that a facility for hospital preadmission be created. There are some measures that are needed to reduce the case cancellation rate and to improve operation theatre utilization, including comprehensive preoperative assessment of patients prior to scheduling, making patients more aware of the planned surgical procedure, and preparing them prior to operation.

Discussion

In this four month hospital based prospective study showed that about 26.7% of elective surgical cases were cancelled in Debre Markos Comprehensive Specialized Hospital, Debre Markos, Ethiopia, 2022 G C. The most frequent reason for cancellation of these elective surgical cases was lack of bed. Cancellation rate of 26.7% for elective surgery found in DMCSH was very high. The reasons for cancellation were lack of bed (50.0%) and patient unfit for anesthesia (15.2%) in DMCSH were the most frequent reasons for cancellation of these elective surgical procedures. In this research, we found that most cancellations were followed by general surgery (49.0%) and orthopedic surgery (21.6%) in DMCSH.

Our study result is similar with the followings; Study conducted in Saudi Arabia the most common cause of patient cancellation was surgery related factors and administrative factors with similar percentage rate (34%) and the least factor was anesthesia related (0%) [10]. A study was conducted in South Africa cancellations were related to equipment (47.4%), 2.8% of cancellations were due to a long preceding surgical procedure [11].

In this study similar to a retrospective cross sectional observational study, selecting all patients scheduled for surgery at the hospital institution in Colombia the causes of cancellation, 93 (38.1%) were attributable to the institution, 99 (40.6) to patients, and 52 (21.3%) to medical orders [12] cancellation records of all elective surgeries scheduled between June 1, 2012, and Jan. 31, 2016, at a medium-sized, tertiary care, academic center in Malawi were retrospectively reviewed. Across 11 surgical specialties, 2933 of 20 881 surgeries (14.0%) were cancelled and of these, 2448 (83.5%) were for administrative or structural reasons [13].

Our study finding similar to a prospective cross sectional study which was conducted at jimma university medical center a total of 454 patients were scheduled to undergo elective surgical procedures, of this 92 patients’ procedures were cancelled. The majority of causes of cancellation of surgical operations were related to hospital administration in 47.83% [14].

In this study contrast to the studies conducted in Nigeria [15], Uganda [16], Brazil [17] and University of Gondar [18] were contrast with the result of our study. This reason may be infera structure recourses available and good administrative in those hospitals set up.

Conclusion and recommendation

The cancellation rate of scheduled surgeries is high in general adult surgery in DMCSH. The majority of causes are foreseeable and avoidable and many are related to the hospital itself.

We recommend that a facility for hospital preadmission be created. There are some measures that are needed to reduce the case cancellation rate and to improve operation theatre utilization, including comprehensive preoperative assessment of patients prior to scheduling, making patients more aware of the planned surgical procedure, and preparing them prior to operation.
