Pinworms \((Enterobius vermicularis)\) mimicking acute appendicitis

**Clinical image description**

Pinworm at base of appendix from a 14-year-old boy admitted with abdominal pain for presumed appendicitis. Pinworms are a parasite of the roundworm family \(Enterobius vermicularis\) (EV) and are the most common worm in the UK. Up to 40% of school children will suffer with this parasite infection at some time in their lives [1].

\(Enterobius vermicularis\) was found in 3.8% of 287 paediatric emergency appendectomies in a large UK paediatric hospital in 2018 [2]. In these patients surgery is associated with unnecessary risk and potential morbidity, but the opportunity cost of operating must also be considered.

Awareness of EV, in combination with a few additional and simple investigations, could help reduce misdiagnosis in this patient group and mitigate both the risks and cost of avoidable surgery.
